30%+ lighting savings

Fluoresave specialises in energy-saving devices for commercial and industrial lighting, which can be installed in new buildings or retrofitted. These intelligent voltage reduction devices have proven to save businesses and public organisations 30%+ on the cost of running their lighting.

Maximum voltage, and hence energy, is required for the ignition of fluorescent and discharge lighting such as sodium, mercury and metal halide. Once ignited there is no need to keep the voltage at such a high level and yet existing lighting systems do.

Because the device reduces the level of power used by the lighting it reduces the running temperature of the lamps, this extends the life of fluorescent tubes and discharge lamps by some 25% or more. This reduces maintenance costs and disposal under the WEEE Directive.
